

XR - Personal Reflection

Nicklas Kühle - 316453

During this semester in the XR course, i've acquired a lot more knowledge about XR development. I've never tried to develop these kinds of applications before, either normal 2D/3D plane games or AR / VR, even apps for mobile devices. During these assignments both me and Christian has been challenged, mostly our AR part feels lacking, as the VR game is fully working and have the functions wished for, so AR was our main struggle i would say. I do think that we could've used more time on our AR project, but i think both me and Christians interest lied mostly in the VR development part, we should have put more time looking into the AR aspect a tad bit earlier, as we felt that we were a bit behind from the start. (TIL: Start in good time) as Christian also had a bachelors project that he was working on, while we were developing the apps.

Christian and i both developed on the AR and VR apps at home, as we have a VR headset available and android phones, one of the major downsides of the android phone that we had available, was that it didn't have any LIDAR. It would've greatly improved the usability of the application we had in mind, as LIDAR is much better in my opinion. During our development process, we've used pair programming along the way.
